### Shamoon 2018 Protection

✓ Jump to solution

I need protection against Shamoon new variant 2018. How do I block based on hash if I have VSE?

Or is there a new signature to prevent this threat?

## Re: Shamoon 2018 Protection 🔗

@avilt There is no need to integrate blocking based on hash additionally to DAT content, as that type of functionality is integrated into the content based on known threats. For more information about this threat, Indication of Compromise, and mitigation instructions, you can reference the Threat Advisory for Trojan-Wiper (aka DistTrack aka Shamoon), [PD25630](#)

### Re: Shamoon 2018 Protection

This advisory was issued in June 2018 and the new variant of Shamoon is released this month Dec 2018.

How do I protect my system from this variant?

How do we achieve hash based blocking in VSE?

### Re: Shamoon 2018 Protection

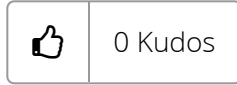

VSE does not have a feature for hash based blocking. This can be achieved with ENS. Based on known hashes I've received from other customers, I can confirm we have coverage. You can also refer to this Threat Advisory for Trojan-Wiper (aka DistTrack aka Shamoon): [PD25630](#)

You can also raise a MALWARE service request with us to check for detection but we would ask you to provide a list of hashes / IoC or samples to check against.
